Technical Reproducibility Validation Report

STRsearch

Version c70179b
Autosomal STR

Verification date	2026-11-01
Repository commit	c70179b3b175adc82a7314409af06900b3861d61
Result	**Runs from its published image; the pinned commit does not build**
Reached	Runs + Expected IO
Permalink	https://strhub.app/verified/strsearch
STRhub	https://strhub.app

SCOPE OF THIS REPORT

Independent automated verification of reproducible execution. It confirms the tool installs, runs end-to-end, and produces structurally valid output in a standardized environment.

This is **not** an analytical validation. Genotype accuracy, concordance, forensic suitability, and regulatory compliance are out of scope.

WHAT WAS VERIFIED

– Source available
– Installation successful
– End-to-end execution
– Output generated

NOT VERIFIED

– Genotype accuracy
– Concordance
– Forensic validity
– Regulatory compliance

1. Executive Summary

PURPOSE	Verify that the tool installs, runs end-to-end, and produces structurally valid output.
RESULT	**Runs from its published image; the pinned commit does not build**
REACHED	Runs + Expected IO, 4/5 gates passed
WHY	The tool's run produced its documented output, on the published environment the README points at: the build from the pinned commit failed, so what ran is the version that environment holds.
SCOPE	Installation, execution, and output structure verification.
NOT EVALUATED	Genotype accuracy · Concordance · Forensic validity · Regulatory compliance

2. As it is in the repository: Verification Gates

Available	The pinned public source exists	PASS
Installs	The environment builds from source	PASS
Runs	Executes end-to-end without crashing	PASS
Expected IO	Produces a non-empty file in the declared format	PASS
Plausible Output	Output structure matches expected genotype-bearing format	—
Execution log	strsearch.log-external.txt	

Stopping at a step is not a finding that the software is faulty. It records how far this particular attempt got. Software can stop early because a dependency it names is no longer available, because it expects input arranged differently from the reference sample, or because the automated environment cannot supply something it needs, such as commercially licensed components. The messages on screen when it stopped are reported below.

3. Not Built From Source: the README's Ready-Made Environment Ran

STRhub tried to build the tool from its source at the pinned commit, following the build steps the repository declares, and the build failed. The published image anjing123/strsearch:latest the README points at was used instead, and every gate below ran on it.

What this means

– **If you are trying to run it:** A build from source at this commit fails in a clean environment; the cause is below. The ready-made environment the README points at does work: it is what this run used.

– **If you are reviewing a paper:** This result describes the software inside that environment, whatever its publisher last put there, and not the pinned commit, which is the version a manuscript would cite.

– **If you maintain it:** The cause could not be classified automatically. The full build output is linked below.

What failed

What happened	Suggested fix
A download in the build failed: https://drive5.com/cgi-bin/upload3.py?license=20191110501245926689	The build fetches that address and did not get the file. If the link is dead or needs a licence, the install steps need a new source for it; if the server was down, trying again will tell.

4. Exact Run Command

This is the command that was executed, verbatim, in the CI environment.

```
# Environment: ubuntu-22.04 · STRsearch c70179b · commit c70179b
$ cd '.' &&
touch /tmp/.strhub_mark &&
( mkdir \
-p example &&
python3 pipeline.py from_bam \
--working_path example/test_results \
--sample test \
--sex male \
--bam /data/in/input.bam \
--ref_bed /data/in/regions.bed \
--genotypes example/test_results/test_genotypes.txt \
--multiple_alleles example/test_results/test_multiple_alleles.txt \
--qc_matrix example/test_results/test_qc_matrix.txt \
); rc=$?; find . \
-xdev \
-type f \
-newer /tmp/.strhub_mark \
-size +0 \
! \
-path './.git/*' \
! \
-path './proc/*' \
! \
-path './sys/*' \
! \
-path './dev/*' \
! \
-path './data/*' \
2>/dev/null |
head \
-500 |
while IFS= read \
-r f; \
do mkdir \
-p "/data/out/$(dirname \
"$f")" &&
cp "$f" "/data/out/$f"; done; exit $rc
```

5. Reproducibility Metadata

Tool	STRsearch
Version	c70179b
Repository	https://github.com/AnJingwd/STRsearch
Commit (pinned)	c70179b3b175adc82a7314409af06900b3861d61
Container OS	ubuntu-22.04
Marker panel	Autosomal STR
Verified on	2026-11-01 12:53:44 UTC
CI run	https://github.com/Tfronta/strhub-verified/actions/runs/41308009228

Verified automatically, in a clean environment, on the tool's public source at the pinned commit. This certificate records what happened; it is not an endorsement by the tool's author.

6. Out of Scope

This report does not evaluate any of the following:

- Genotype correctness or accuracy
- Concordance against known truth sets
- Sensitivity, specificity, or stutter performance
- Allele calling accuracy or forensic casework suitability
- Regulatory compliance or ISO accreditation
- Multi-laboratory or multi-dataset reproducibility

7. Output Content Evidence

Output file	example/test_results/STRsearch/CSF1PO_results_test.txt
Format	TSV
Sequence records	35
Distinct STR loci	0
Total reads	0
Max depth (single locus)	0

8. Verification Data

The repository ships example data (35 file(s)); this run did not use it. STRhub ran the verification using the public reference dataset listed below. That dataset is a slice around 24 forensic STR loci, not a whole genome: it carries reads only at the loci listed below. A small test file in the repository lets a new user run the tool on their first day and see it working before trusting it with their own data, and it lets a verification run against the author's own sample as well as this one. Publishing the output that file should produce helps just as much: it shows what the results are meant to look like, which is what a reader needs to tell a correct run from one that merely finished.

Dataset	Illumina BAM (hg38), NA12878 (autosomal, female)

Source	https://ftp-trace.ncbi.nlm.nih.gov/ReferenceSamples/giab/dat…
License	Open access (GIAB / NIST). Research and educational use. STRhub is not the data provider.
Ref. genome	GRCh38 / hg38
Loci tested	—
Regions BED	Provided by STRhub

9. Verification Matrix

PASS	Reference dataset	Illumina BAM (hg38), NA12878 (autosomal, female)
	README check (5/5)	Advisory: all items present
	Install / environment setup	Present
	Run command	Present
	Expected input format	Present
	Produced output format	Present
	Dependencies / versions	Present

10. What This Run Needed Beyond the Repository

The result above describes a run configured as follows. Anyone repeating it needs the same things.

– Test data: no sample from the repository was used, so a public reference sample stood in.

– A container environment: the build from the pinned commit failed, so the published image anjing123/strsearch:latest the README points at was built instead. What ran is the version that environment holds, not necessarily the pinned commit.

11. Notes from Reading the Repository

Recorded automatically from the tool's public files when this run was configured. Not verified by execution, and not part of the gates above. Useful for what to check by hand.

– Environment: the repository's own Dockerfile was built as-is. If it does not build, the published image anjing123/strsearch:latest the README points at stands in, and the report says so.
– Input: the README documents BAM and FASTQ (line 77); this run used STRhub's illumina-bam-hg38 reference data.
– The output directory the command writes into (example) was created first.
– 1 input path(s) in the README command replaced with /data/in/input.bam.
– 1 BED path(s) replaced with /data/in/regions.bed.
– Run command: the README's own command, rewritten to STRhub's mounts; everything it created was captured as output.
– Regions: STRhub's ready-made strsearch file for the dataset's panel loci (STRhub records the strsearch layout for a program of this name).
– README mentions hg19/GRCh37 only; STRhub reference BAMs are hg38

12. Limitations

– Single reference dataset per input type
– Single containerized environment (Docker / ubuntu-22.04)
– No truth-set comparison or ground-truth genotypes
– No accuracy or concordance assessment
– No forensic validation of results
– Short-read limitations apply (very long STR alleles may not span reads)

13. Scope and Disclaimers

Executed end-to-end in the stated environment with output in the expected format. Concerns reproducible execution only; no claim of accuracy, casework fitness, or regulatory validation.

Each result is a dated snapshot, verified on the tool's public repository at a pinned commit. STRhub does not store tool source code.

14. Conclusion

◆ **Runs end-to-end**

STRsearch c70179b installs and executes without error in an environment built from the published image anjing123/strsearch:latest the README points at, after the build from the pinned commit failed.

◆ **Produces output in the declared format**

The tool wrote a non-empty TSV file. Whether its contents look like genotype data was not established at this level.

◆ **Verdict: Runs**

The tool's run produced its documented output, on the published environment the README points at: the build from the pinned commit failed, so what ran is the version that environment holds.

◆ **Repository test data not used**

The repository ships example data (35 file(s)), which this run did not use: the gates above ran on STRhub's reference dataset. STRhub Verified supplied Illumina BAM (hg38), NA12878 (autosomal, female) as the reference input for this verification run. Users replicating this result should use the same or equivalent publicly available reference material.

◆ **Reproducibility statement**

The exact command reported in Section 3, executed at the pinned commit in the described environment, is sufficient to reproduce this verification result independently.
