STRsearch: publication under review

Evidence insufficient

The published report links CI run 42254219171, which tested a curated recipe that installed and ran, rather than the claimed source-install failure. Recovered trials 42067018462 and 42483706971 used a published image and recorded successful installation with an undetermined source-commit verdict. They do not support the published usearch download failure. No exact originating artifact for that failure report and extract was established.

Editorial correction, not a new verification

Prepared 2026-11-09T17:22:49Z. No tool was executed and no historical gate, command or log was rewritten. The former execution claim is withdrawn pending sufficient evidence. This is not a finding that the tool works or fails.

Preserved original publication

Review record and file hashes

Open preserved evidence

Recovered evidence

Original artifacts from runs 41308009228, 42067018462 and 42483706971 are preserved independently with their recipes and logs. The latter two use anjing123/strsearch:latest, installed successfully, and classify source-commit execution as undetermined. These different procedures cannot be presented as evidence of the source-build failure. Their historical conclusions have not been re-certified against the new strict policy.
